

knowyourpit

knowyourpit. own your cook.

The identity system for the AI BBQ coach that reads your live cook and calls the next move — from fire-up to serve.

PLAN · start to serve SEQUENCE · full spread COACH · pitmaster ai TRACK · every cook

01 foundation

Everything else in this guide serves what's on this page. The mission is why we exist, the positioning is who we're for and why we're different, and the values are how we show up. When a decision is unclear, it's answered here.

MISSION

turn your live cook data into **real-time pitmaster feedback** — making the right call at the right time.

Not another readout. The value isn't the number — it's the decision. We read the cook as it happens and tell you what to do about it.

POSITIONING

whether bbq is your summer or your life, knowyourpit is the **ai bbq coach in your corner** — reading your cook in real time and telling you exactly when to make the next move. other apps show you temperatures; we turn them into a pitmaster's call.

The audience isn't a place or a skill level — it's a spectrum of devotion. We never call anyone a beginner. From the summer-weekend cook to the every-day-is-BBQ-season pitmaster, the coach meets you where you are.

VALUES — HOW WE SHOW UP

01

coach, never lecture

We talk like the friend who happens to be an award-winning pitmaster — direct, generous, on your side. We assume you're capable, explain the why, and never talk down, no matter how new you are.

02

respect the craft

BBQ is patience, fire, and feel. We're here to sharpen that, not replace it. The cook stays the pitmaster; we're the coach in the corner — we never pretend the app does the cooking.

03

built for the fire, not the showroom

Every choice serves someone standing at a smoker at 5am: dark, legible, calm, one thing at a time. If it looks good in a portfolio but fails by the pit, it loses.

02 logo & icon

The mark is a kettle grill whose interior temperature graph doubles as the product's core idea. The ember-gradient flame rises above it. The wordmark sets **know** and **pit** in charcoal with **your** in ember — the personal middle, the part that's *yours*. Every variation below is provided in the project files; use the one whose linework contrasts with its surface.

FULL LOCKUP — GRILL + WORDMARK

primary

white mark · on smoke

light surfaces

dark mark · on bone

dark surfaces

white mark · on charcoal

ICON — GLYPH ONLY, FOR APP TILE & AVATARS

primary

white mark · on smoke

light surfaces

dark mark · on bone

dark surfaces

white mark · on charcoal

clear space

Keep a margin equal to the height of the flame on all sides. Nothing — type, edges, other logos — enters that zone.

don't

- ✗ Recolor the flame or swap the ember gradient for a flat fill
- ✗ Set the full lockup on a busy photo — use the glyph or add a scrim
- ✗ Stretch, rotate, or add a drop shadow to the mark
- ✗ Make **your** charcoal **know** / **pit** ember — the split is or fixed
- ✗ Rebuild the wordmark in a different typeface

MINIMUM SIZES

The graph line inside the grill is the first detail to collapse when the mark shrinks. Below its floor, the nodes merge into a smudge and the "data inside the grill" idea is lost — so the icon and the full lockup have different limits.

120px

60px

40px · floor

24px · too small

the rules

Icon	40px / 0.4in minimum. Below this the interior graph is illegible — use the simplified fallback (grill + flame, no graph) instead.
Full lockup	120px / 1in wide minimum, so "knowyourpit" stays readable. Under that, drop the wordmark and use the icon alone.
Clear space	Scales with the mark — always one flame-height on every side, at any size.

app icon

Master	1024×1024px, no transparency, no rounding — iOS/Android apply the mask.
Field	Smoke #393532 with the white-linework mark, so the icon reads on both light and dark home screens.
Safe area	Keep the mark within the center ~80%; corners get clipped by the platform mask.
Small renders	Notification and Settings sizes fall below the graph's floor — ship the simplified fallback for these slots.

ICONOGRAPHY

Icons are outline, not filled — thin, rounded strokes that echo the linework of the grill mark. The flame is the one exception: it's the single filled, ember-colored shape in the whole system. That contrast is the rule — line-work everywhere, one warm fill.

temperature

flame · filled

home

icon rules

Style	Outline only, ~1.8px stroke at 24px, rounded caps and joins. No filled or duotone icons.
The flame	The one filled shape, always ember. Never outline the flame; never fill any other icon.
Grid	24px artboard, 2px padding. Match optical weight to the grill mark's linework.
Color	Bone or ash by default; ember or indigo only when the icon marks a live or planned action.

don't

- ✗ Mix filled and outline icons in the same view
- ✗ Fill any icon but the flame
- ✗ Use heavy or hairline strokes — keep the 1.8px weight consistent
- ✗ Color an icon ember or indigo unless it marks a live or planned action

03

color

Charcoal is the foundation — the app is always dark, by design, for readability beside a live fire. Two accents carry meaning, and each means one thing: **ember** is *now* — live cooks, primary actions, the flame; **indigo** is *planned* — scheduling, sequencing, the timeline. Never swap them. The signal colors are separate again, reserved for status. Bone and ash carry the type.

EMBER — THE SIGNATURE GRADIENT · LIVE / NOW

INDIGO — SECONDARY ACCENT · PLANNED / SCHEDULED

indigo
#6C3BF6
Planning, sequencing, timeline, "you are here"

indigo dim
#3A2A6E
Timeline dots, muted tints, upcoming states

CHARCOAL — SURFACES

char 900
#0E0E10
Splash & deepest surface

char 800
#161618
Card & sheet base

char 600
#26262A
Borders & dividers

smoke
#393532
Logo field, warm dark

NEUTRALS & SIGNALS

bone
#F4F1EA
Primary text on dark

ash
#B4B0A9
Secondary text

on time
#4E9E6A
all_good · early / on time

behind
#D69A2B
running_behind · late drift

flare
#C14931
flare_up · alerts

Contrast: bone on char-900 = 15.8:1 · ash on char-900 = 8.4:1 · ember-orange on char-900 = 4.9:1 (large/UI only)

04 typography

A condensed display face gives the brand its confident, all-lowercase voice — echoing the wordmark. Inter handles the interface. A mono face carries the thing this app is actually about: temperatures, timers, and drift.

BARLOW SEMI CONDENSED

Display & headlines.
Always lowercase.
Weights 700–800. Used
with restraint — one big
statement per screen.

low & slow.
the pull is a decision
knowyourpit

INTER

Body, labels, buttons.
Sentence case in the UI.
400–600. The neutral
workhorse.

Your brisket hit 165°F at 4:12 — right on schedule. Wrap now and you'll rest by 6. The stall lasted 51 minutes, about average for this grill.

JETBRAINS MONO

Data, temps, timers,
drift, IDs. Tabular figures
so numbers never jump.

203°F · 06:41:22 · +12 min late · pit 225°F

voice

Talk like the best pitmaster you know coaching a friend: specific, encouraging, and honest about what the numbers say. Name what happened and what to do next. Never hype, never apologize for the fire.

✓ SOUNDS LIKE US

"165°F reached — wrap now to stay on schedule."

"Running 12 minutes behind. Bump the pit to 250°F to catch up."

"You're in the stall. Hold steady — the next move is to wrap in about 20 minutes."

"Your bark scored a 4. The stall ran long — try wrapping earlier next time."

"knowyourpit. own your cook."

✗ NOT US

"Oops! Something went wrong 😬"

"Get ready for the ULTIMATE grilling experience!!!"

"Your meat is probably done soon-ish."

"Sorry to bother you, but maybe check the temp?"

in the app

The product is dark-only and status-driven. Cook state and step drift map to a fixed set of signal colors so a pitmaster can read a screen at a glance from across the yard.

CHECK-IN & DRIFT STATES

all good

running behind

flare up

low fuel

on time

+12 min late

surfaces

Stack char-900 base → char-800 cards → char-600 hairline borders. No pure black, no pure white. Radius 14px on cards, 999px on pills and status chips.

two accents, each with a job

Ember means now — the active cook, the primary action, the flame. Indigo means planned — scheduling, sequencing, the timeline. Keep them in their lanes; a screen's color tells you at a glance whether you're looking at something live or something scheduled. Signal colors stay separate, for status only.

SPACING — A 4PX BASE

The app is built on Tailwind, so spacing steps in multiples of 4px. Pick from the scale; don't invent in-between values. 4 and 8 handle tight rhythm inside a component; 16 and 24 separate elements and pad cards; 32+ sets section breaks.

07

product ui

The brand's truest expression is the app itself. These are real screens — the reference for how charcoal, ember, the signal colors, and the pitmaster voice come together in practice. When designing anything new, match these.

home — live on the smoker

Active cooks surface first, each with its health grade, targets, and one ember call-to-action.

plan a cook

Cut, weight, grill, targets. The ember "Start Cooking Now" is the one primary action on the screen.

meat cut picker

Every cut carries its real targets — internal, pit, and time per pound. Data, not decoration.

live temperature

The ember trace against charcoal — the signature motif, live. Target line in green, pit in blue.

pitmaster coaching

The voice in action — a plain-language call ("keep pit steady at 250°F") tied to the check-in data.

cook health grade

The A-F grade with a signal color and a one-line read. The number always resolves to a judgment.

session schedule

The full cook timeline — light, on, wrap, pull, serve — with "you are here" and per-step check-ins.

multi-cook sequence

Multiple cooks timed to finish together, with an amber heads-up when the schedule misses the target.

RESOLVED — TWO-ACCENT SYSTEM

ember means now, indigo means planned

These screens use **indigo** for planning and sequencing (the "Single Cook" toggle, "Save Cooks to My Plan," the Session Schedule) and **ember** for live-cook actions. That split is intentional and now documented in the color section: the two accents encode *live vs. planned*, so a screen's color tells you which you're looking at. Keep each in its lane.

Still to clean up: the green "**Cook Now**" button reuses signal-green as a control color — green should mean status, not action. And a few **blue** tints (the "pit" temperature chips) sit outside the palette. Neither is part of the ember/indigo logic; both are noise to reconcile in the next design pass.

08 messaging

One brand line, one descriptor, and a short list of proof points. Lead with the promise, back it with the specific capability. This is the language for the App Store, the site, and any ad.

the line

knowyourpit. own your cook.

The brand tagline. Names the app, then the promise — knowing your cook is how you own it. Use it as a sign-off, not mid-sentence.

the descriptor

AI BBQ coach

What it *is*, in three words — the coach in your corner, not a passive readout. Never "grilling app," never just "planner." Category-defining, not generic.

PROOF POINTS — THE FIVE THINGS IT DOES

plan, start to serve

Tell it the cut, the weight, and the serve time. It builds every window — light, on, wrap, pull — and alerts you.

sequence a spread

Multi-Cook works backwards from serve time so brisket, ribs, and chicken all finish together.

scan a temp reading

Upload a photo of a probe display or another app's graph — knowyourpit reads the temperature off the image and logs it.

frozen-to-table

Factors your thaw method into the timeline so you still hit serve time, safely.

live probes

Connect MEATER, ThermoWorks, and various Bluetooth thermometers, and set target alerts.

knowyourpit. own your cook.
